Priva's Sustainable Development Goals (SDG)

Priva's Sustainability Development Goals

"Our mission goes far. We are well aware that we cannot do it alone nor offer a solution to all world problems. But with our vision of how to deal with food production and the increasing world population, we do want to contribute to a better world. We want to further shape our CSR policy in the coming years. We are happy to show you how."

SDG 6.3 & 6.4 Improving water quality and water use efficiency

Priva solutions increase the efficiency of water use for food production through optimal irrigation and reuse of drain water. In addition, contamination of surface and sewage water can be prevented by water disinfection and the breakdown of pesticides prior to discharge.

SDG 7: Affordable and sustainable energy

SDG 7.3: Increasing energy efficiency
With the help of smart control technology and artificial intelligence (A.I.), Priva aims to make installations more energy-efficient and to be the first to use sustainable energy sources. Both in buildings and in greenhouses.

SDG9.4: Priva solutions result in a more efficient use of natural resources, such as energy and water.

Our control technology makes it possible to create smart infrastructures that contribute to making cities more sustainable.

SDG 11: Sustainable cities and communities

SDG 11.3 & 11.6: Priva wants to contribute to inclusive and sustainable urban development and reuse of waste streams. Priva is a driver of sustainable urban development and collaboration in this area across sectors. We are continuously expanding our partner network to make this happen.
